Myelin PO protein precursor (Myelin protein zero) (Myelin peripheral
protein) (MPP).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    MEDLINE=900404; PubMed=2478717; Saavedra R.A., Fors L., Aebersold R.H., Arden B., Horvath S., Sanders J., Hood L.; Aebersold R.H., Arden B., Horvath S., Sanders J., Hood L.;

"The myelin proteins of the shark brain are similar to the myelin proteins of the mammalian peripheral nervous system.";
J. Mol. Evol. 29:149-156(1989).
-!- FUNCTION: Creation of an extracellular membrane face which guide the wrapping process and ultimately compacts adjacent lamellae.
-!- SUBCELIULAR LOCATION: Type I membrane protein.
-!- TISSUE SPECIFICITY: Found only in peripheral nervous system
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Eukaryota; Metazoa; Chordata; Cramiata; Vertebrata; Chondrichthyes;

evidence for early expression in avians.";
J. Neurosci. Res. 25:143-151(1990).
-!- FUNCTION: Creation of an extracellular membrane face which guide the wrapping process and ultimately compacts adjacent lamellae.
-!- SUBCELLULAR LOCATION: Type I membrane protein.
-!- TISSUE SPECIFICITY: Found only in peripheral nervous system

                                                                                                                                                                                                                                                                                                  C. Schwann cells.
C. -!- SIMILARITY: Belongs to the myelin P0 protein family.

R. PONCTION: Crucial in the assembly, expression, and functional modulation of the heterotrimeric complex of the sodium channel. C. The beta-2 subunit causes an increase in the plasma embrane consulation and in its folding into microvilli (By similarity). C. SUBCNIT: BETA-1 RND BETA-2 SUBUNITS: BETA-1 IS NONCONLENTLY LINKED BY DISULIDE MINE MARCHEN P. R. BETA-1 IS NONCONLENTLY SUBCRILUAR LOCATION: Type I membrane protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   MEDINE=99104330; PubMed=9887383;

XI "Epithelial V-like antigen (EVA), a novel member of the immunoglobulin superfamily, expressed in embryonic epithelia with a potential role as homotypic adhesion molecule in thymus histogenesis.";

I Cell Biol. 141:1061-1071(1998).

I Cell Biol. 141:1061-1071(1998).

I Cell Biol. Mediates homophilic cell-cell adhesion.

I SUBCELLULAR LOCATION: Type I membrane protein (Probable).

I TISSUE SPECIFICITY: Expressed in liver and gut, skin, and testis but not in thymocytes, lymphocytes, macrophage or dendritic cells or cell lines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This SWISS-PROT entry is copyright. Pimenta A.F., Fischer I., Levitt P.;

"cDNA cloning and structural analysis of the human limbic-system-
associated membrane protein (LAMP).";

Gene 170:189-195(1996).

- !- FUNCTION: MEDIATES SELECTIVE NEURONAL GROWTH AND AXON TARGETING.

CONTRIBUTES TO THE GUIDANCE OF DEVELOPING AXONS AND REMODELING OF
MATURE CIRCUITS IN THE LIMBIC SYSTEM. ESSENTIAL FOR NORMAL GROWTH

OF THE HYPPOCAMPAL MOSSY FIBER PROJECTION (BY SIMILARITY).

-!- SUBCELLULAR LOCATION: Attached to the membrane by a GPI-anchor.

-!- TISSUE SPECIFICITY: Expressed on limbic neurons and fiber tracts
as well as in single layers of the superior colliculus, spinal
                                                                                                                                                 Bukaryota, Metazoa, Chordata, Craniata, Vertebrata; Buteleostomi,
Mammalia, Eutheria, Primates, Catarrhini, Hominidae, Homo.
                                                                                                                                                                                                                                                                                                                                            chord and cerebellum. SIMILARITY: Belongs to the immunoglobulin superfamily. IgLON

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                oŧ
                                                                                                                                                                                                                                             "Identification and characterization of two members of a novel class of the interleukin-1 receptor (IL-IR) family. Delineation of a new class of IL-IR-related proteins based on signaling.";
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   INCLEASE SERSE-2; Sequence=VSP_008056, VSP_008057;
Note=may be due to an intron retention;
INSUE SPECIFICITY: Detected in fetal brain after day 12.5, in particular in parts of the diencephalon and in the basal plate of the spinal cord. In postnatal brain detected in cerebral cortex, olfactory bulb, in the CA1 region of the hippocampus and in Purkinje cells of the Xth cerebellar lobule.

SIMILARITY: Belongs to the interleukin-1 receptor family.
SIMILARITY: Contains 3 immunoglobulin-like C2-type domains.
                                                                                                                                                                                                                                                                                                                                                                                                                central
X-linked interleukin-1 receptor accessory protein-like 2 precursor
(ILIRAPL-2 related protein) (TIGIRR-1).
ILIRAPL2.

Genomics 9:751-757(1991).

-I- FUNCTION: Creation of an extracellular membrane face which guides the wrapping process and ultimately compacts adjacent lamellae.

-I- SUBCELLULAR LOCATION: Type I membrane protein.

-I- TISSUE SPECIFICITY: Found only in peripheral nervous system
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Rattus norvegicus (Rat).

-!- FUNCTION: Creation of an extracellular membrane face which guides the wrapping process and ultimately compacts adjacent lamellae.
-!- SUBCELLULAR LOCATION: Type I membrane protein.
-!- TISSUE SPECIFICITY: Found only in peripheral nervous system
                                                                                                                                    X-RAY CRYSTALLOGRAPHY (1.9 ANGSTROMS) OF 30-148.

Schwann cells.
-!- PTM: N-LINKED GLYCAN IS SULFATED.
-!- SIMILARITY: Contains 1 immunoglobulin-like V-type domain.
-!- SIMILARITY: Belongs to the myelin P0 protein family.
                                                                                                                                                                                                                                                                                                                                               PIRI, JOGG22; MPRTO.

Biochem. Biophys. Res. Commun. 236:682-686(1997).
-!- FUNCTION: May play a role in cell-cell recognition and signaling.
-!- SUBCELLULAR LOCATION: Type I membrane protein.
-!- TISSUE SPECIFICITY: Expressed in normal gastrointestinal epithelium and in 95% of colon cancers.
-!- PTM: N-GLYCOSYLATED, CONTAINS APPROXIMATELY 8 KDA OF N-LINKED CARBOHYDRATE.
                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     SEQUENCE FROM N.A., AND PARTIAL SEQUENCE.

"Two novel members of the interleukin-1 receptor gene family, one deleted in Xp21.3-Xp21.3 mental retardation.";

Eur. J. Hum. Genet. 8:87-94(2000).

-!- SUBCELLUIAR LOCATION: Type I membrane protein.

-!- SUBCELLUIAR LOCATION: Type I membrane protein.

-!- TISSUE SPECIFICITY: Detected at low levels in fetal and adult brain, in particular in the frontal lobe, temporal lobe and cerebellum. Detected at very low levels in skin, liver, fetal ovary and in placenta.

-!- SIMILARITY: Belongs to the interleukin-1 receptor family.

-!- SIMILARITY: Contains 3 immunoglobulin-like C2-type domains.
                                                                                                                                                                                                                                                                                                                                                                                                                   class
